

EDUGENIE

Project Design Phase

1. Design Overview: The EduGenie design phase converts the identified requirements into a clear system structure, user interface, database design, and module-level design. The system is planned to be simple, responsive, secure, and easy for students to use.

2. System Architecture:

EduGenie follows a layered design consisting of the **Presentation Layer** (student/admin interface), **Application Layer** (business logic and services), and **Database Layer** (users, learning content, quizzes, and progress data).

3. Main Modules:

Module	Design Description
User Module	Registration, login, profile, and user access.
Learning Module	Subjects, study materials, and educational content.
Quiz Module	Questions, quiz attempts, scores, and results.
Progress Module	Tracks completed activities and learning progress.
Admin Module	Manages users, content, questions, and system data.

4. Database Design:

The database stores user details, subjects, learning resources, questions, quiz results, and progress records. Proper relationships and validation are used to maintain data consistency.

5. User Interface Design:

The interface includes a login page, dashboard, subject/resource pages, quiz screen, result page, progress view, and admin dashboard. Navigation is kept simple so students can find learning activities quickly.

6. GetUpLink:

GetUpLink is the proposed access link/connection point for EduGenie. It provides users with a direct and convenient way to reach the EduGenie platform and its designed modules.

7. Design Outcome:

The design phase provides the technical blueprint for developing EduGenie, including its architecture, modules, database, interface, and user flow.
